How can I get a list with the status of the nodes associated to my queue?

```bash
[testuser@login-node-1-0 ~]$ qstat -f -q myqueue.q
queuename                        qtype resv/used/tot. load_avg    arch          states
---------------------------------------------------------------------------------
myqueue.q@compute-1-0.local       BIPC  0/4/8          6.44     linux-x64
......
```

The three numbers in the 3rd column are the number of slots reserved (we don't use that feature), occupied and the total available on that particular node for the queue myqueue.q.
