Remote Desktop (RDC)

Through the Brandeis VPN, faculty and staff members can remotely connect to their campus computer (referred to as the target computer going forward) from other locations (either somewhere else on-campus or off-campus entirely). There are some preliminary steps which must be performed on your target computer first to enable this, and which vary by operating system.

Before you begin

1. The target computer needs to have a static IP before continuing. See this page for more details: Static IP addresses

2. You must first connect the non-target (Usually off campus) computer to the campus VPN with Pulse Secure before continuing (even if both computers are on campus). See instructions on this page: Using the Brandeis VPN

Setting up a Connection

There's a different process for RDC depending on what operating systems are involved.

- **Windows -> Windows**
  - Setup the target Windows computer with these instructions: For Windows 10, For Windows 7, For Windows XP
  - Then use Windows RDC to establish the remote connection. Instructions can be found on this page: RDC PC to PC Knowledge Base page

- **Mac -> Windows**
  - Setup the target Windows computer with these instructions: For Windows 10, For Windows 7, For Windows XP
  - Then use Microsoft Remote Desktop to establish the remote connection. See instructions on this page: RDC Mac to PC

- **Mac -> Mac**
  - Use MacOS Screen Sharing. Instructions can be found on this page: Screen Sharing in OS X

Important Notes on Wormhole and Security

If you've configured your target and other computers as detailed above and are unable to connect, ensure that you're running the latest version of Java.

Using the Brandeis VPN service subjects the user to the same restrictions and responsibilities as a campus user. Connections via VPN are considered direct connections to the campus network. All connection attempts are logged.

VPN users will be automatically disconnected from the Brandeis network after a predetermined amount of inactivity. The user can immediately logon again to reconnect to the Brandeis network - no work will have been lost.

Additionally, please be mindful of where you use the VPN to connect to your desktop. All computers connected to Brandeis internal networks via VPN must use the most up-to-date anti-virus software; this includes personal computers. Malicious software can log your keystrokes and steal your password. Do not use the VPN in cyber cafes, public clusters or from any computer that you do not completely trust.
